

Features

- Adjustable output voltage or 1.5V, 1.8V, 2.6V, 3.3 V, 5.0V output voltage
- 1.0 A output current
- Low dropout voltage, typ. 1 V
- Short circuit protection
- Overtemperature protection
- Wide operating range up to 40 V
- Wide temperature range of $T_j = -40$ to 150 °C
- Suitable for use in automotive electronics
- Green Product (RoHS compliant)
- AEC Qualified

Functional Description

The TLE 4284 is a monolithic integrated NPN type voltage regulator that can supply loads up to 1.0 A. The chip is housed in a surface mounted PG-TO252-3-11 package (DPAK). It is designed to supply microprocessor systems or other loads under the severe conditions of automotive applications and therefore it is equipped with additional protection against overload, short circuit and overtemperature.

An input voltage V_I in the range of $(V_Q + V_{DR}) < V_I < 40$ V is regulated to V_Q . The dropout voltage V_{DR} ranges from 1.1 V to 1.4 V depending on the load current level.

The device operates in the temperature range of $T_j = -40$ to 150 °C.

Type	Package	Marking

Note: Within the operating range, the functions given in the circuit description are fulfilled.

The values listed in the “Electrical Characteristics” tables are ensured over the operating range of the integrated circuit unless otherwise specified. Typical characteristics specify mean values expected over the production spread. If not otherwise specified, typical characteristics apply at $T_A = 25\text{ °C}$ and the given supply voltage.

Application Information

Figure 4 Typical application circuit of fixed output voltage versions and adjustable output voltage version

Typical Performance Characteristics

Current Consumption I_q versus Junction Temperature T_j

Current Consumption I_q versus Input Voltage V_i

Current Consumption I_q versus Output Current I_Q

Adjust Current I_{ADJ} and Reference Voltage V_{Ref} vs Junction Temperature T_j

Output Voltage V_Q versus Junction Temperature T_j

Output Current Limit I_{Qmax} versus Junction Temperature T_j

Dropout Voltage V_{DR} versus Junction Temperature T_j

Safe Operation Area (SOA): Output Current I_Q vs. Input Voltage V_I

Output Voltage V_Q versus Input Voltage V_I

Power Supply Ripple Rejection versus Frequency

Stability Region: Equivalent Serial Resistor ESR versus Output Current I_Q

Power Supply Ripple Rejection versus Frequency

Load Regulation: Delta Output Voltage dV_Q versus delta Output Current dI_Q

Load Regulation: Delta Output Voltage dV_Q versus delta Output Current dI_Q

Load Regulation: Delta Output Voltage dV_Q versus delta Output Current dI_Q

Line Regulation: Delta Output Voltage dV_Q versus delta Input Voltage dV_I

Line Regulation: Delta Output Voltage ΔV_Q versus delta Input Voltage ΔV_I

Application Hints

Adjustable Version

At the fixed voltage TLE 4284 devices, the output voltage is divided internally and compared to an internal reference of 1.25 V typical. The regulation loop controls the output voltage to achieve the output voltage of 5 V, 3.3 V, 2.6 V, 1.8V or 1.5V. The variable version compares the voltage difference between the adjust pin ADJ and the output pin Q to the internal reference of typically 1.25 V. The output voltage is adjusted by an external voltage divider between Q, ADJ and GND and calculates:

$$V_Q = V_{REF} \times \left(1 + \frac{R_2}{R_1} \right) + I_{ADJ} \times R_2$$

For the variable regulator TLE 4284 DV, a minimum load current of 5 mA is necessary in order to keep the output voltage regulated. If the application does not assure this minimum load requirement, the output voltage divider should be dimensioned sufficiently low-ohmic: $R_1 \leq 240 \Omega$.

For the variable voltage type an additional decoupling a capacitor C_{ADJ} at the adjust pin improves the ripple rejection ratios. Placing C_{ADJ} requires an increased output capacitance of $C_Q \geq 22 \mu\text{F}$.

Output

The output current limitation is reduced as a function of the input voltage for high input voltages above 25 V.

The TLE 4284 requires a 10 μF output capacitor with $0.1 \Omega \leq \text{ESR} \leq 10 \Omega$ for the stability of the regulation loop.

At the input of the regulator a capacitor is necessary for compensation of line influences. A serial diode should be used to eliminate negative voltages from the input. As a minimum, a 100 nF ceramic input capacitor should be used. If the regulator is used in an environment with long input lines, an input capacitance of 10 μF is recommended.

Package Outlines

Figure 5 Dimensions PG-T0252-3-11

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
